

## Bulbs

In general, bulbs grow best in a well-drained soil that is rich in organic matter. Where soils contain too much clay, add organic matter (e.g. peat moss) and/or gypsum. Bulbs have specific fertilizer requirements.

Prior to planting apply [Blood and Bone](#) or [Paton's Blood and Bone Plus K](#) at 100 grams per square metre. This should be worked into the soil. For lower fertility soils it is advisable to also work in a general fertilizer such as [Banana Special](#) at 50 grams per square metre.

Prior to flowering, apply [Nutrafeed 23](#) at 4g/litre of water. Do not apply to flowering plants
